"We will probably see the spread of computer utilities, which, like present electric and telephone utilities, will service individual homes and offices across the country."
Len Kleinrock (1969)

"A computational grid is a hardware and software infrastructure that provides dependable, consistent, pervasive, and inexpensive access to high-end computational capabilities." I. Foster, C. Kesselmann (1998)

"The sharing that we are concerned with is not primarily file exchange but rather direct access to computers, software, data, and other resources, as is required by a range of collaborative problem-solving and resource-brokering strategies emerging in industry, science, and engineering. The sharing is, necessarily, highly controlled, with resources providers and consumers defining clearly and carefully just what is shared, who is allowed to share, and the conditions under which sharing occurs. A set of individuals and/or institutions defined by such sharing rules what we call a virtual organization." I. Foster, C. Kesselmann, S. Tuecke (2000)
Introduction: Grid Literature

Books:

Articles:

DESY:

Introduction: This Talk

- Give an(other) introduction into the idea of Grid Computing
- Fill the gap between high level information and actual installations
- Describe how DESY is involved
- Describe and discuss the DESY Grid Testbed
- Provide a look-and-feel of the Grid Testbed's functionality
- Give a perspective for the future
Introduction: Contents

- Introduction
- Grids
- Grid Activities at DESY
  - DESY Grid Testbed
  - dCache
  - ILDG (International Lattice Data Grid)
- EGEE (EU’s Enabling Grids for E-Science in Europe)
- (D-Grid Initiative)
- Conclusions

Grids?

- Compute Grids
- Data Grids
- Science Grids
- Access Grids
- Knowledge Grids
- Bio Grids
- Sensor Grids
- Cluster Grids
- Campus Grids
- Tera Grids
- Commodity Grids

- Funding Concept?
- Marketing Slogan?

“A Grid is a system that:

coordinates resources which are not subject to centralized control …

-> integration and coordination of resources and users of different domains vs. local management (batch) systems

… using standard, open, general-purpose protocols and interfaces …

-> standard and open multi-purpose protocols vs. application specific systems

… to deliver nontrivial qualities of services.”

-> coordinated use of resources vs. uncoordinated approaches (web)

**Grids: Types**

**Data Grids:**
- provide transparent access to data which can be physically distributed within Virtual Organizations (VO)

**Computational Grids:**
- allow for large-scale compute resource sharing within Virtual Organizations (VO)

**Information Grids:**
- provide information and data exchange, using well defined standards and web services
Grids: Schematics

Grids: HEP Motivation

Data Grid Hierarchy (CMS)

1 TIPS = 25,000 SpecInt99
PC (today) = 10 SpecInt99

Busch crossing per 12 sec
500 triggers per second
Event size = 14 bytes in size

Tier 1
Tier 0
Tier 2
Tier 3
Tier 4

Physics data cache
Workstations

Physicists work on analysis "channels"
Each institute has 10 physicists working on one or more channels
Data for these channels should be cached by the institute server

Monarc Project
Grid Projects

HEP Grids Worldwide
HEP Grids in Europe

Andreas Gellrich, DESY IT Group

Globus: (http://www.globus.org)
- Toolkit
- Argonne, U Chicago

EDG (EU Data Grid): (http://www.eu-datagrid.org)
- Project to develop Grid middleware
- Uses parts of Globus
- Funded for 3 years (1.4. 2001 - 31.3.2004)

LCG (LHC Computing Grid): (http://cern.ch/lcg)
- Grid infrastructure for LHC production
- Based on stable EDG versions; other approaches in the US (VDT)

EGEE (Enabling Grids for E-Science in Europe): (http://www.eu-egee.org)
- Grid infrastructure for enhanced science in Europe
- 4 years, first phase funded (1.4.2004 – 31.3.2006)
Certificates

- Authorization and authentication are essential ingredients of Grids
- A **certificate** is an encrypted electronic document, digitally signed by a Certification Authority (CA)
- A Certificate Revocation List (CRL) is published by the CA
- For Germany, GridKa issues certificates on request (needs ID copy)
- Contacts at DESY: R. Mankel, A. Gellrich

- Users, hosts, and services must be certified
- The **Globus Security Infrastructure (GSI)** is part of the **Globus Toolkit**
- GSI is based on the *openSSL Public Key Infrastructure (PKI)*
- X.509 certificates are issued
- The certificate is used via a token-like proxy
- Example: `/O=GermanGrid/OU=DESY/CN=Andreas Gellrich`

Virtual Organizations (VO)

- A **Virtual Organization (VO)** is a dynamic collection of individuals, institutions, and resources which is defined by certain sharing rules.

  - Technically, a user is represented by his/her certificate
  - The collection of authorized users is defined on every machine in `/etc/grid-security/grid-mapfile`
  - This file is regularly updated from a central server (LDAP)
  - The server holds a list of all users belonging to a collection
  - It is this collection we call a VO

  - The VO a user belongs to is not part of the certificate
  - A VO is defined in a central list, e.g. an LDAP directory
  - In our case there is a VO on a central server
DESY does not participate in LHC and is therefore not in LCG

Germany’s main hub (regional centre: Tier-1) in LCG is GridKa at FZ Karlsruhe

DESY’s technical Grid activities:
- Grid Testbed
- dCache
- International Lattice Data Grid (ILDG)

DESY’s (official) way to the Grid:
- Enabling Grids for E-Science in Europe (EGEE)
- D-GRID Initiative for an e-Science infrastructure in Germany, starting not before 2005 w/ a budget of 10-20 M€/year for 3 years

The Grid Testbed was initiated by IT and H1 (R. Gerhards, A. Gellrich)
It is an open initiative to study Grids (mailto:grid-dev@desy.de)
Main developers: M. Vorobiev (H1), J. Nowak (H1), A. Gellrich (IT)
Further members: A. Campbell (H1), B. Lewendel (HERA-B), S. Padhi (ZEUS), C. Wissing (H1 Do), P. Wegner (DV); growing …

Its main purpose is to test basic functionalities of the Grid middleware
It is implemented in collaboration with the Queen Mary University London QMUL (Dave Kant) that also takes part in the UK GridPP and LCG projects
An example HEP application could be Monte Carlo simulation
The Grid Testbed exploits 11 Linux PCs donated by H1 and HERA-B
- grid001 – grid011 run DESY Linux 4 (S.u.S.E. 7.2) (Linux 2.4.18)
- Grid middleware of EDG 1.4 (http://www.eu-datagrid.org)
- EDG 1.4 is based on Globus 2.4 (http://www.globus.org)
- Note: LCG-2 will use EDG 2 (?) (http://cern.ch/lcg)
- EDG and Globus are built on/for RedHat Linux 6.2
- Normally Grid nodes are set up from an installation server (lcfg)
- The EDG distribution allows to download binaries
- Those binaries where modified and installed on the DL 4 machines

Authentication:
- Grid Security Infrastructure (GSI) based on PKI (openSSL)
- Globus Gatekeeper, Proxy renewal service
- A central LDAP-server defines the VOs

Grid Information Service (GIS):
- Grid Resource Information Service (GRIS)
- Grid Information Index Service (GIIS)

Resource Management:
- Resource Broker, Job Manager, Job Submission, Batch System (PBS), Logging and Bookkeeping

Storage Management:
- Replica Catalogue, GSI-enabled FTP, GDMP
- Replica Location Service (RLS)
Grid Testbed: Set-up cont’d

Testbed hardware:
- Mapping of services to logical and physical nodes.
- User Interface (UI)
- Computing Element (CE)
- Worker Node (WN)
- Resource Broker (RB)
- Storage Element (SE)
- Replica Catalogue (RC)
- Information Service (IS: BDII, GIIS)
- LDAP VO-server (VO)

Grid Testbed: Schema
Grid Testbed: Monitor
Grid Testbed: Job Example

- Submission of a simple job into the Grid Testbed
- Job delivers hostname and date of worker node
- Requires a certified and authorized user
- Grid Environment
- Job script/binary which will be executed
- Job description by JDL
- Job submission
- Job status request
- Job output retrieval

```

Typical HEP job:
• Executable, environment, input data, output data
• Monte Carlo simulation: big input, big output
• Analysis: huge input, small output
• Reprocessing: huge input, huge output

RB problem:
• Can not transfer huge data files with job
• Optimize for computing resources or data resources

LCG:
• Let RB locate data and send the job there
• Let the WN retrieve data if necessary (not nice!)
Grid Testbed: Minimal Set-up

Per site:
- User Interface (UI) to submit jobs
- Computing Element (CE) to run jobs
- Worker Node (WN) to do the work
- Storage Element (SE) to provide data files
- [Grid Information Index Service (GIIS) as site-MDS]

Per Grid:
- Resource Broker (RB)
- Replica Catalogue (RC)
- Information Service (IS: BDII, GIIS)
- VO-server (VO)

Grid Testbed: Observations

System aspects:
- DESY Linux 4 installation is possible but clumsy
- Grid middleware penetrates system software

Information Service:
- Weak points in Globus (LDAP not scalable w/ writing)
- Rebuilt in EDG and LCG (R-GMA: RDBMS rather than LDAP)

Resource Broker:
- Plays central role
- Needs to store all data coming with the job (resource intensive)

Computing / Storage Element:
- Probably scalable w/ more worker nodes (farms)
- Not fully understood yet
Grid Testbed: Future Plans

Testbed: (still under way)
- Get the missing pieces running (site-GIIS, SE)
- Connect (again) to QMUL
- Get more minimal sites involved: DESY Zeuthen, U Dortmund, ...
- The Grid Testbed is not application or experiment specific!
- The Grid Testbed is not meant for production!

Prototyping of HEP applications: (next step)
- Open for various DESY HEP applications
- Monte Carlo simulations is a good candidate
- **Remember**: Applications sit on top of the middleware w/o modifications

Production: (far future)
- Would need new (or) appropriate hardware
- Will there be one DESY-wide Grid infrastructure?

dCache

- The dCache project is a joint effort between the Fermi National Laboratories (FNAL) and DESY, providing a fast and scalable disk cache system with optional Hierarchical Storage Manager (HSM) connection
- **Besides various other access methods**, the dCache implements a grid mass storage fabric:
- dCache supports gsiftp and http as transport protocols and the Storage Resource Manager (SRM) protocol as Replica Management negotiation vehicle
- dCache is in production for all DESY experiments
- dCache is a strategical platform at FNAL (Tevatron exp., US-CMS); O(10)
- CERN shows big interest in dCache!
International Lattice Data Grid

- [http://www.lqcd.org/ildg/](http://www.lqcd.org/ildg/)
- ILDG develops an international Data Grid for the lattice field theory community
- **Metadata WG**: An XML Schema suitable for describing the data generated by lattice field-theory is developed (member: D. Pleiter)
- **Middleware WG**: A heterogeneous Grid-of-Grids based on Web Services API to connect to archives (NERSC, CP-PACS, UKQCD) (member: A. Gellrich)
- Testbeds to test interoperability: aggregate replica catalogues, starting with just listing the contents of the Grid-of-Grids
- Allow public access via Web Services and/or HTTP
EGEE (Enabling Grids for E-Science in Europe) aims to integrate current national, regional and thematic computing and data Grids to create a European Grid-enabled infrastructure for the support of the European Research Area, exploiting unique expertise generated by previous EU projects (DataGrid, Crossgrid, DataTAG, etc) and national Grid initiatives (UK e-Science, INFN Grid, Nordugrid, US Trillium, etc).

The EGEE consortium involves 70 leading institutions in 27 countries, federated in regional Grids, with a combined capacity of over 20000 CPUs, the largest international Grid infrastructure ever assembled. The EGEE vision is to provide distributed European research communities with a common market of computing, offering round-the-clock access to major computing resources, independent of geographic location, building on the EU Research Network Geant and NRNs. EGEE will support common Grid computing needs, integrate the computing infrastructures of these communities and agree on common access policies. The resulting infrastructure will surpass the capabilities of localized clusters and individual supercomputing centres, providing a unique tool for collaborative computer and data intensive e-Science. EGEE will work to provide interoperability with other major Grid initiatives such as the US NSF Cyberinfrastructure, establishing a worldwide Grid infrastructure.

EGEE is a two-year project in a four-year programme. Major implementation milestones after two years will provide the basis for assessing subsequent objectives and funding needs. Two pilot applications areas have been selected to guide the implementation and certify the performance of EGEE: the Particle Physics LHC Grid (LCG), where the computing model is based exclusively on a Grid infrastructure to store and analyze petabytes of data from experiments at CERN; Biomedical Grids, where several communities are facing equally daunting challenges to cope with the flood of bioinformatics and healthcare data, such as the proposed HealthGrid association. The project objectives will be achieved by the aggregation of the human and computing resources of regional Grid federations established by EGEE, by a complete re-engineering of the middleware, and by a pro-active program of outreach and training to attract and support the widest possible variety of scientific communities in the ERA.
EGEE: Mission

EGEE is the successor of the EDG.

Three-fold mission:

- To deliver production level Grid services
- To carry out a professional Grid middleware re-engineering
- To ensure an outreach and training effort (dissemination)

EGEE: SA Structure

Layer 0: Resource Centers (RC)
- DESY

Layer I: Regional Operations Centres (ROC)
- FZ Karlsruhe

Layer II: Core Infrastructure Centres (CIC)
- FZ Karlsruhe

Layer III: Operations Management Centre (OMC)
- CERN
EGEE: Main Activities

**Networking** (Network Activities, NA):
- NA1: Management of the I3
- NA2: Dissemination and Outreach
- NA3: Training and Induction
- NA4: Application identification and Support
- NA5: Policy and International Cooperation

**Services** (Specific Service Activities, SA):
- SA1: Grid operations, Support and Management
- SA2: Network resource provision

**Middleware** (Joint Research Activities, JRA):
- JRA1: Middleware Engineering and Integration Research
- JRA2: Quality Assurance
- JRA3: Security
- JRA4: Network Service Development

---

EGEE@DESY

- Volker Gülzow (Member)
- Andreas Gellrich (Deputy)
- SA1 (Specific Service Activities)
- European Grid Support, Operation and Management

- Partner of the German ROC
- Support Centre and Resource Centre
- User and Administrator Support, CPU and Storage provision

- DESY will receive funding of ~148 k€ for 2 years
- DESY is committed to provide infrastructure
EGEE: Timeline

- May 2003: Proposal
- 10 Oct 2003: Submission of Technical Annex (TA)
- 17 Oct 2003: Final negotiation with EU
- 20 Oct 2003: DESY signs contract (CPF)
- 30 Nov 2003: Consortium Agreement (CA) signing
- 1 April 2004: Project start
- 16-23 April 2004: Kick-off Meeting, Ireland

What I missed

- GAN (Global Accelerator Network)
- Other Toolkit approaches
- Other LCG middleware projects (VDT,...)
- Non-HEP Grid applications (synchrotron radiation etc.)
- Commercial / industrial applications
- Many, many technical details
- Many political aspects
- ...

Andreas Gellrich, DESY IT Group
Grid@DESY, Zeuthen, 11 November 2003
Conclusions

- Grids have developed from smart ideas to real implementations
- Grid infrastructure will be standard in (e)-science in the future
- LHC can *not* live w/o Grids (LCG)
- DESY *could* live w/o Grids *now*, but would miss the future

- There are projects under way at DESY
- The EGEE project officially opens the Grid field for DESY
